

MRI Implant Safety Review & Charge

Your Safety Comes First

If you have an implanted device—such as a spinal cord stimulator, aneurysm repair, port, or surgical hardware—our team must complete a detailed MRI implant safety review before your exam. This step is required by national safety standards to ensure we can safely perform your MRI.

Spinal stimulator

Port (for medication/chemo)

Surgical Hardware

What This Safety Review Includes:

- Verifying your device's exact model and manufacturer
- Reviewing FDA and MRI-conditional guidelines
- Consulting national device safety databases
- Determining the safest MRI settings, including magnet strength and positioning
- Working with your provider if additional information is needed

Why There Is a Charge & Our Commitment to You

The implant safety review requires trained staff, specialized resources, and additional verification steps to ensure your MRI can be performed safely and according to national standards. A small charge helps cover the cost of this required process. We never add unnecessary fees—and we never perform an MRI with an implant until safety is fully confirmed.

If you have questions about this review or the charge, our team is here to help.
